

Child Identification Sheet

Paste Child's Photo Here

Please complete the DNA evidence gathering in the comfort of your home. This will ensure you have a good sample and allow the necessary time for drying in a sterile-type environment.

- Take a clean cotton swab and rub firmly, but gently on the inside of the child's cheek. The idea is to collect cells, not saliva.
- Take the swab and place it upright in a container (The idea is to let the air circulate around the swab until it is completely dry. One method is to invert a paper cup and stick the non-swabbed end through the end of the cup).
- Do NOT touch the swab!
- Let the swab dry for 24 hours.
- Remove the swab from the container and place in a paper envelope. Place that envelope and this sheet into a plastic freezer or storage bag.
- Safe places for storage of the bag include a fireproof box, or the freeze compartment of the refrigerator. (Do not place in a safe deposit box at a bank or other facility, as the goal is easy accessibility).

****The DNA sample need never be redone as long as it is kept completely dry.**

If desired, press the child's thumb to an ink-pad or color with a marker and press firmly inside the square above.

*****Children under the age of one year should be photographed every 2 months. After the first year and until the age of 7 a photograph should be taken every six months. Seven years until age 18 a yearly photograph is suggested. Updated photos may be placed inside plastic storage bag with this sheet and DNA swab.*****

Child's Full Name: _____ Nicknames: _____ Date of Birth: _____

Social Security #: _____ - _____ - _____ Age when photo was taken: _____ Height: _____ Weight: _____

Hair color: _____ Eye Color: _____ Circle One: Male / Female

Identifying marks or scars: _____

This sheet is provided to you by the Shepherdsville Police Department.
